Doctor (Mina Gobrail)

Mina Gobrail is our client and the person who issued the software to be completed. He is a doctor studying at UofT for a Masters of Health Informatics. He is also the CEO of eHealth Access. He has been working for 15+ years in pharmaceuticals.

Mina Gobrail is highly adept at technology and sees it as an opportunity for everyone to have better access to health information. His goal is patients to achieve better therapeutic outcomes and improved quality of life.

When using this system, Mina would like to see ease of access to all the information that is accessible on his website as well as a good visual indication of where different information is stored, He would like to be able to use the website without any difficulty and should be able to add/ delete pages of prescriptions as needed

User

In this case we will be using an older aged user, one with a few prescriptions and daily medications that they take. The user will be a female that is unfamiliar with technology and has not been keeping accordance with her daily medications. The user has been referred to this website by their pharmacist.

As the user is unfamiliar with technology, navigating web pages can be hard and they would be lost in a complex website. They do see some good in technology but it can be frustrating if they cannot find what they need in a short amount of time.

The user should be able to find all the information they need in a few or less searches. The website should be visually clear as to where to search for things and how to look up questions such as usage and dosage. The website should allow the user to keep in adherence with all their prescriptions/medications easier.

Developer

We are the developers of the website/search bar. We are third year students at UTM with good knowledge of programming and scrum methods of completing work. We all wish to learn from this experience and gain key skills to become software engineers/programmers.

As Computer Science students we have a high interest in anything technology related and are able to learn programs unfamiliar to us. We have learned many languages and became adept at using different IDE's to develop different projects
As the developer we want to see our client and our users satisfied with the website. That is we have developed the website so that any doctor can add/remove information and finds it well informed enough.

And also, the users find it organized and clear as where information can be found, the user should not be frustrated using our website.
